All of the more expensive programs have an easy point and click  backup process for easy system backup. If a program has a higher version  that has a backup and performance optimizer, I would buy that one if it  was not too much more expensive. Even if the program cost a good twenty  dollars more I would probably still go with that one because of the  simplicity of the use of an all in one program.

I have used  several internet security suites and can tell you that they are not all  the same. Some are better at detecting threats, some have more features,  some are easier to use. After doing the research, I would say that the  best ones, in order from best to fourth best are Norton 360, Norton  Internet Security, BitDefender Total Security and Webroot SecureAnywhere Complete 2013.

You may ask why I am telling you about these top  security suites, and the answer is simple, they are the highest  performing, easy to use programs on the market right now.

If you  do the research yourself you will see that all these programs have 2 or  more versions, for example Norton Internet Security and Norton 360. I am  telling you what are the best choices to use as preventative  maintenance tips go.

The other versions of these top 4 range  anywhere from **$10 to $20 cheaper than their counterparts**                                                                . Their are even  free antivirus and internet security programs on the market, which  unless you are barely using the internet I would stay clear from. The  reason that you want to pay the extra 10-20$ is the system and file  backups and the computer tune-ups that are provided with these.

The  program that I would use on my computer would be Norton 360 because It  does the best at protecting my computer as well as providing me with an  easy solution to backing up and speeding up my computer, it does it for  me. It is also good for up to 3 computers. The price for this is 89.99,  but can be found at discounted prices.

**Norton Internet Security** is  ten dollars cheaper but it does not come with the ability to make a backup or optimize your computers speed and performance. There are also  free programs

which I will again reiterate are not going to protect you  if you are on your internet a lot.

**BitDefender Total Security** is a  little bit cheaper than Norton, and comes with everything you need for  $79.95, or once again to save only $10 you will lose the backup and  tune-up capability with BitDefender Internet Security for $69.95. For a  single computer, which is available with BitDefender, the prices would  be $69.95 and $59.95 respectively, meaning you might as well get the  3-pack for the better deal.

**Webroot** is almost as good as Norton  except it does not provide spam filters or parental control. $79.99 for  Webroot SecureAnywhere Complete (3-pack), and $59.99 for Webroot SecureAnywhere Internet Security Plus (3-pack). The internet security  suite does not have the backup and tune-up. Webroot is the smallest and  lightest security suite, so it does not take up a lot of space on your  computer and would be a quick download if ordering a digital copy.
